

Can you insert declared variables in database Laravel 4

 stackoverflow.com/questions/26235313/can-you-insert-declared-variables-in-database-laravel-4

I am fairly new to everything and I am wondering if it is possible to store declared variables in to database?

For example(these are placed in the *nameoffilecontroller.php*),

```
public function onewayflightshow()
{
    $a=Session::get('children');
    $b=Session::get('adult');
    $c=Session::get('infant');
    $d=Session::get('destinationto');
    $e=Session::get('destinationfrom');
    $f=Session::get('departure');

    $results = DB::table('oneways')->get();
    if (!empty($results))
        foreach ($results as $user)
        {
            $adultFee = ($user->fare)*$b;
            /*-----Child Fee-----*/
            $partialFee1 = ($user->fare)*.05;
            $partialFee2 = ($user->fare)-$partialFee1;
            $childFee = $partialFee2*$a;
            /*-----Infant Fee-----*/
            $partialFee3 = ($user->fare)*.10;
            $partialFee4 = ($user->fare)-$partialFee3;
            $infantFee = $partialFee2*$c;

            $payment = ($adultFee+$childFee+$infantFee);
            var_dump($payment);
        }

    $rules = array(
        'title' => 'required',
        'lastname' => 'required',
        'email' => 'required|email',
        'cemail' => 'required|same:email',
        'firstname' => 'required',
        'middlename' => 'required',
        'birthday' => 'required',
        'city' => 'required',
        'streetadd' => 'required',
        'zipcode' => 'required|max:4',
        'country' => 'required',
        'home' => 'required|max:7',
        'mobile' => 'required|max:12'
    );

    $validator = Validator::make(Input::all(), $rules);
    if ($validator->fails()) {

        $messages = $validator->messages();
        return View::make('content.onewayflightfillup')->withErrors($validator);
    }
}
```

```

} else {
    $reserve = new Reserves;
    $reserve->title = Input::get('title');
    $reserve->lastname = Input::get('lastname');
    $reserve->firstname = Input::get('firstname');
    $reserve->middlename = Input::get('middlename');
    $reserve->birthday = Input::get('birthday');
    $reserve->city = Input::get('city');
    $reserve->streetadd = Input::get('streetadd');
    $reserve->zipcode = Input::get('zipcode');
    $reserve->country = Input::get('country');
    $reserve->home = Input::get('home');
    $reserve->work = Input::get('work');
    $reserve->fax = Input::get('fax');
    $reserve->mobile = Input::get('mobile');
    $reserve->email = Input::get('email');
    $reserve->children = Session::get('children');
    $reserve->children = Session::get('adult');
    $reserve->children = Session::get('infant');
    $reserve->children = Session::get('destinationfrom');
    $reserve->children = Session::get('destinationto');
    $reserve->children = Session::get('departure');
    $reserve->$payment; <-- IS THIS EVEN POSSIBLE?

    $reserve->save();
    var_dump($reserve);
    return View::make('content.onewayflightbooklist');
}}

```

I am trying to `save()`; everything in my database, from the session variables to the inputted values from the user but the problem is I don't know how to insert `$payment` into the database table. Is it even possible? If yes, what are the way/s of doing it?
